

What Makes A Star Portfolio: From Funds Down to Stocks

With the rapid wealth growth and the increasing awareness of asset management, people have been paying more and more attention to investing personal assets into various kinds of funds and related financial derivatives. This phenomenon motivates us to investigate portfolios of different equity. In this project, we decide to focus on US equity funds since they can serve as a perfect example of an almost pure portfolio that invests in only one kind of asset class. Here we select 100 portfolios that have the highest 5Y annual return from MorningStar.com. This project intends to analyze the features that a star portfolio shares, from a general perspective (funds) narrowing down to its partial composition (stocks).

Cosine Similarity Among Portfolios

Cosine Similarity Among Portfolios

Cosine Similarity Among Portfolios

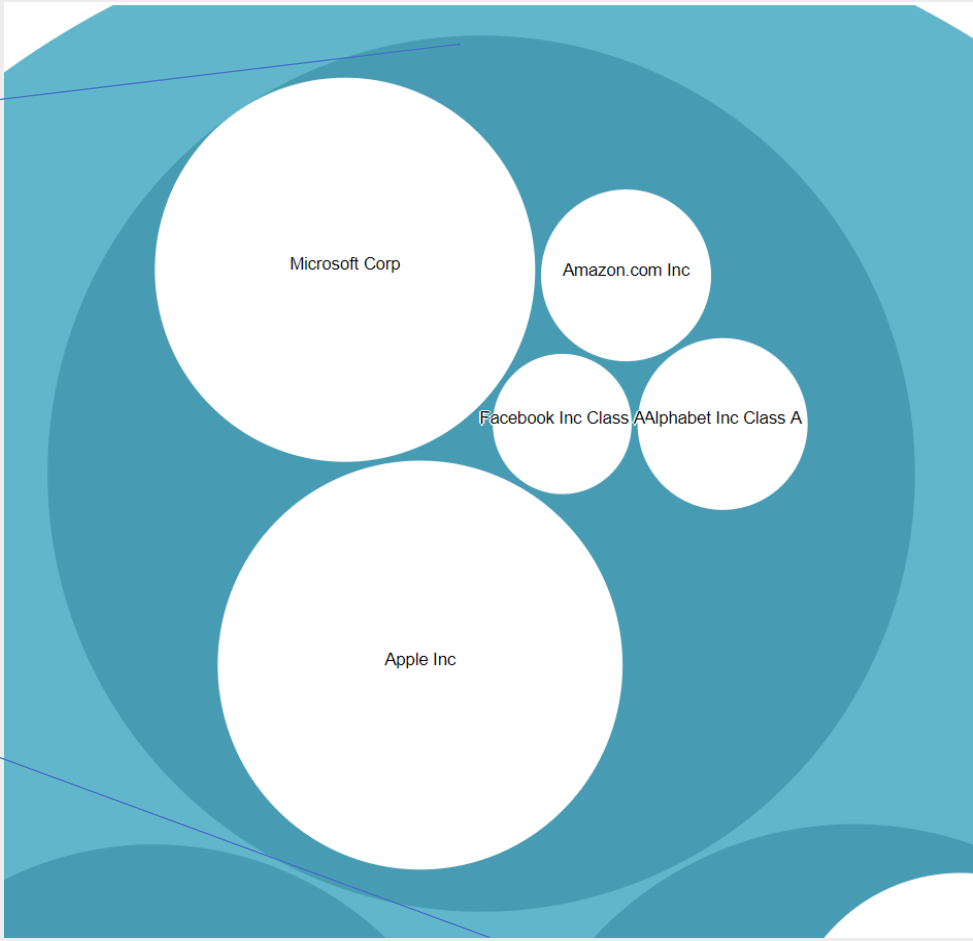

- Description:** The force network describes the similarity between different portfolios. We extracted the large blends portfolios and recorded all the 96 holdings involved in these portfolios. Each portfolio is transformed into a 96*1 vector, representing the weight of each holding. If one portfolio doesn’t involve a holding, the vector is 0 at that point. The size of the node represents the total assets of that specific portfolio.
- Interactivity:** The network enables the visualization of all the edges connecting the nodes with widths that differ from each other representing the similarity. The network also facilitates the dragging of multiple viewing perspectives.
- Conclusion:** Large blend portfolios are largely related to each other. They have similar investment behaviors.

- Description:** The Stacked-area chart presents the daily closing price trend of the 10 most popular invested stocks in all portfolios from 2019.6 to 2021.6. A portfolio’s performance is highly related to its holding, the aim here is to see how a stock’s performance is related to time.
- Interactivity:** There is a brush effect in the chart enabling overall and daily changes of stock’s closing price. The legends on the right can be chosen to highlight the corresponding stock’s area in the chart.
- Conclusion:** The global pandemic has a great influence on the whole market. In February 2020 when Covid-19 started in the US, there is a drastic drop in all ten stocks.

Distribution of Most Popular Stock within Different Scales

- Description:** This zoomable circle visualization focuses on the one top holding of each portfolio, which are in fact 100 stocks. The aim is to see if the star portfolios have faith in the same stock. The largest circle represents the pool while the median circles are clustered by the total assets of the portfolios. The small circles in the median circles then represent the top choice holdings.
- Interactivity:** This vis enables the highlight and clicks interaction. Users can click each circle to see the next level embedded.
- Conclusion:** For example, many Median blend portfolios share the same top holding of Apple Inc and Microsoft while some of them share the same top holding of Amazon and Alphabet. 10 portfolios may have the same top holdings so here we only have 5 stocks in the pool of median portfolios. We found that the top choice among the large portfolios is rather onefold while with the decreasing among of assets invested, the portfolio’s top choices tend to vary.

A star portfolio is a genuine combination of adequate assets, sparse holding distributions, unique tastes and the power of hedging the risks!
